

Recruitimation — End-to-End Test Guide

A walkthrough for running the full Recruitimation workflow. The app is **already deployed to the cloud**, so for the core test you don't install anything — you just need a web browser (Chrome recommended).

Live URLs

App (use this): <https://frontend-production-5ab2.up.railway.app>

API (behind the scenes): <https://backend-production-a0d3.up.railway.app>

What the tool does: it takes job candidates (pasted, or scraped from Indeed/LinkedIn by a browser extension), scores them with AI for *fit* and *willingness to take the job*, lets you swipe through them (keep / pin / skip), drafts outreach messages, and logs everything for an applicant-tracking system (ATS).

Part 1 — Test the full workflow in the live app (no install, ~10 min)

Do these in order. Each step says what you should see if it's working.

Step 1 — Open the app and view jobs

1. Go to [the app](#).
2. You land on the **Jobs** page. There should already be one job: **Forklift Operator**.

✓ **Success: you see the Forklift Operator job card.**

Step 2 — Create your own job

1. Click **New Job** (or the "+" button).
2. Fill in, for example — Title: Warehouse Associate ; Description: Pick and pack orders in a distribution center. Lift up to 40 lbs, operate pallet jacks, reliable attendance. Day shift. Will train. ; Location: Columbus, OH ; Pay range: \$16-18/hr
3. Save.

✓ **Success: the new job appears in the list.**

Step 3 — Paste & Parse a candidate (the AI scoring core)

The fastest way to see the AI work — no extension needed.

1. Go to the **Paste / Parse** page (the `/parse` view in the top nav).
2. On the left, pick your job or paste the job description.
3. On the right, paste a candidate profile. Sample:

```
Marcus Bell
Columbus, OH 43215 | (614) 555-0182 | marcus.bell@email.com

Work Experience:
Assembly Technician - Honda Manufacturing, Marysville OH - Mar 2022 to Present
- Assembled subcomponents on the line, met daily quota, operated torque tools
Warehouse Associate - Amazon, Etna OH - Jun 2020 to Feb 2022
- Picked and packed orders, lifted up to 50 lbs, forklift certified

Skills: hand tools, torque wrench, forklift, quality inspection, teamwork
Last active: 3 days ago
```

4. Click **Parse & Score**.

 **This takes up to ~2 minutes.** The free AI tier is slow. This is a known limitation, not a bug — be patient and the result will appear.

✓ **Success: a candidate card with extracted name/phone/email, a Match score, a Willingness score, a one-line summary, risk flags, and parsed job history + skills.**

Step 4 — Add candidates to a job (simulating the extension)

Candidates from Indeed already live under the **Forklift Operator** job (ID `4db74ca3-4da9-45cf-92d2-8d3b857a8252`). Open it to see them. The optional extension test in Part 2 adds more.

✓ **Success: the Forklift Operator job lists scored candidates, sorted by match score.**

Step 5 — Swipe through candidates

1. Open a job with candidates, then open the **Swipe Deck**.
2. For each card: **Keep**, **Pin** (save for later, optional note/date), or **Skip**.
3. Click through a few.

✓ **Success: cards advance as you decide; a progress indicator moves.**

Step 6 — Review the Results grid

1. Open the **Results** view for that job.
2. Filter by **Keep / Pin / Skip / All**.
3. Click a candidate for full detail (scores, history, PDF viewer if a résumé was uploaded).

✓ **Success: your Step 5 decisions are reflected here.**

Step 7 — Draft and "send" outreach

1. On a **Keep** candidate's detail page, generate an outreach draft. (*AI-generated — give it up to a minute.*)
2. Edit the message, then click **Looks good / Send**.
3. Note: this **does not actually message the person** — it marks the message sent and logs it. Real sending is manual by design, so contact credits aren't wasted.

✓ **Success: the draft appears, is editable, and after sending shows a sent timestamp.**

Step 8 — Check the ATS log + export

1. Keep + send auto-logs the candidate to the ATS as "submitted".
2. Use **Export CSV** (ATS) to download the log.

✓ **Success: a CSV downloads with candidate/job/stage rows.**

That's the full end-to-end loop: job → candidate in → AI scoring → swipe decision → outreach → ATS log.

Part 2 — (Optional) Test the browser extension

The extension scrapes candidates off Indeed/LinkedIn. You can test its scraping **without an Indeed employer account** using the included fixture. This part needs the code.

```
git clone https://github.com/onghaig/recruitimation.git
cd recruitimation
```

A) Test the scraper with the fixture (no Indeed needed)

1. In Chrome, open `file:///path/to/recruitimation/extension/test/indeed-fixture.html`
2. Click **"1. Scrape this page"** → you should see 3 candidates as JSON.
3. Paste `4db74ca3-4da9-45cf-92d2-8d3b857a8252` into the job-ID box, click **"2. POST to /api/ingest"**.
4. Open the app → **Forklift Operator** → the 3 new candidates appear and score within ~30s.

✓ **Success: scraped candidates show up scored in the dashboard.**

B) Load the actual extension into Chrome

1. Go to `chrome://extensions`
2. Turn on **Developer mode** (top-right).
3. Click **Load unpacked** → select the `extension/` folder.
4. Click the icon → set API URL to `https://backend-production-a0d3.up.railway.app` → **Save**.
5. A green **Connected** dot means it reaches the backend.

The extension only auto-scrapes on a real `employers.indeed.com/.../applicants` page. Without an employer account, the fixture in step A is how you verify it.

Known quirks (so they're not surprises)

- **AI steps are slow (~1–2 min)** on the free tier. Scoring and outreach drafting both take time. It's working; just wait.
- **The app is wide open** — no login yet; anyone with the URL can use it. Fine for this test (see the security note your friend sent along).
- **No real messages are sent.** Outreach "send" only logs; you message the candidate yourself on the platform.

Appendix — Running it all locally (optional)

Not needed for the test above, but to run the backend yourself:

```
git clone https://github.com/onghaig/recruitimation.git
cd recruitimation
docker compose up -d                # Postgres + Redis

cd backend
cp .env.example .env                # fill in NVIDIA_API_KEY and R2_* keys
npm install
npm run db:push                      # create tables
npm run dev                         # API on http://localhost:3000

cd ../frontend
npm install
npm run dev                         # app on http://localhost:5173
```

The backend process also runs the AI scoring worker, so no separate worker command is needed.

The whole thing is one app: a React frontend, a Node/Fastify backend with a Postgres database and a Redis queue, and a Chrome extension — all deployed on Railway.
